

Phase 5:

Apex Programming for Home Maintenance and Repair Management

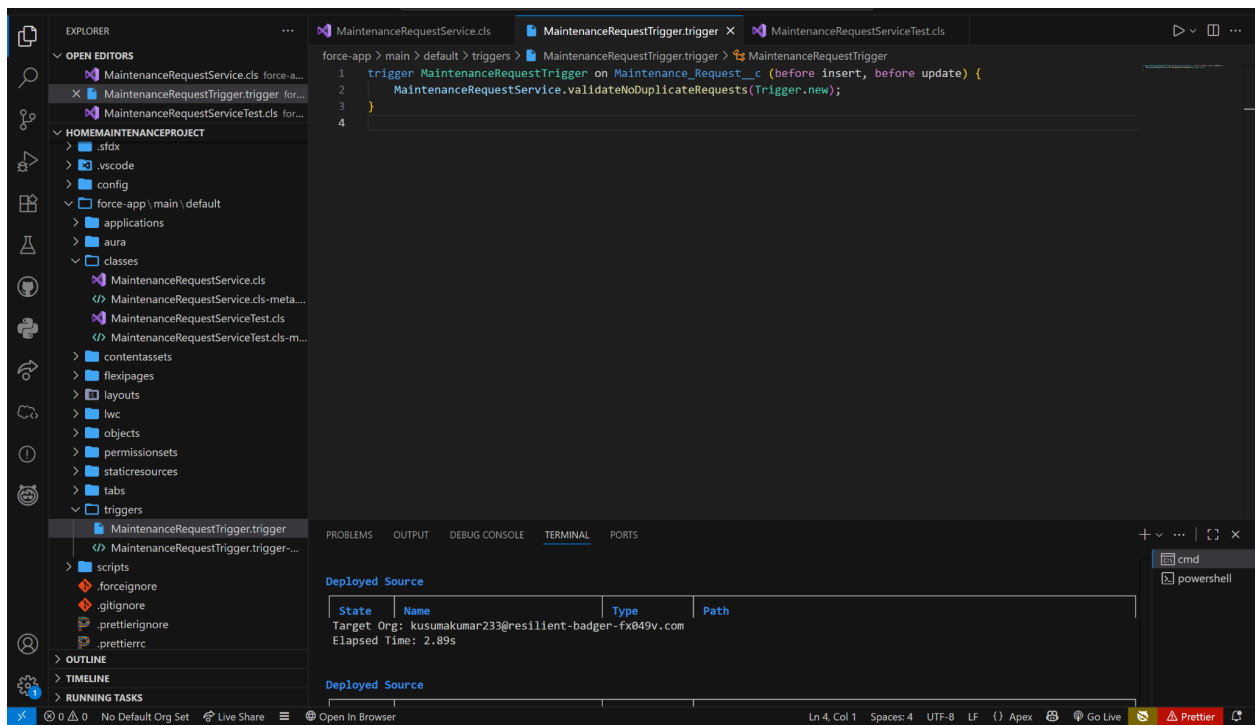

Step 1: Apex Classes & Objects

- Create a service class, e.g., MaintenanceRequestService, to hold all business logic related to maintenance requests.
- Main responsibilities:
 - Validate new maintenance requests (e.g., prevent duplicate requests for same asset and issue within a time window).
 - Enforce business rules centrally for reuse by triggers and other automations.
 - Keep triggers lightweight and focused only on orchestration.
- Design clean, modular, and reusable code patterns.

Step 2: Apex Triggers

- Implement a trigger MaintenanceRequestTrigger on Maintenance_Request__c object.
- Trigger runs before insert and before update to block invalid or duplicate maintenance requests.
- Use the service class for all validations and processing logic.
- Follow the Trigger Handler Design Pattern to separate context management from logic.

Step 3: Test Classes

- Write a dedicated test class for the service class and trigger.
- Positive test case: successful submission of a unique maintenance request.
- Negative test case: prevent duplicate maintenance request for the same asset and issue.
- Add assertions to verify expected behavior.
- Ensure 75%+ code coverage for deployment.
- Deactivate conflicting automations/flaws during testing if needed for consistency.

The screenshot shows the Visual Studio Code interface with the Explorer sidebar on the left displaying a project structure for 'HOME MAINTENANCE PROJECT'. The main editor window shows the file 'MaintenanceRequestServiceTest.cls' with the following Apex code:

```
1 @isTest
2 public class MaintenanceRequestServiceTest {
3     @isTest static void testValidateNoDuplicateRequests() {
4         Asset__c asset = new Asset__c(Name='Test Asset');
5         insert asset;
6
7         Maintenance_Request__c req1 = new Maintenance_Request__c(
8             Asset__c = asset.Id,
9             Description__c = 'Leaking pipe',
10            Status__c = false // Status as Boolean (e.g., false means open)
11        );
12        insert req1;
13
14        Maintenance_Request__c req2 = new Maintenance_Request__c(
15            Asset__c = asset.Id,
16            Description__c = 'Leaking pipe',
17            Status__c = false
18        );
19
20        Test.startTest();
21        try {
22            insert req2;
23            System.assert(false, 'Duplicate maintenance request was not blocked');
24        } catch (DmlException e) {
25            System.assert(e.getMessage().contains('Duplicate maintenance request'));
26        }
27        Test.stopTest();
28    }
29 }
30
```

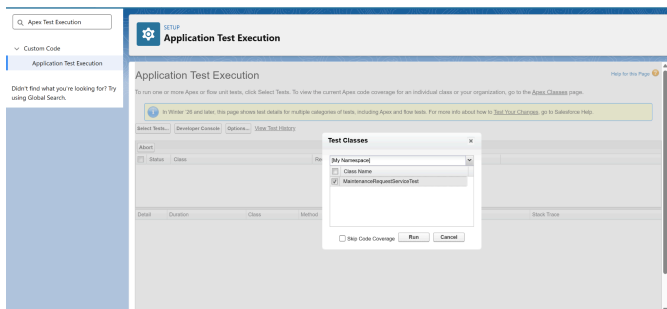

```
C:\Users\KUSUMA KUMAR\HomeMaintenanceProject>sf project deploy start --source-dir force-app/main/default --target-org HomeMaintenancePlaygroup

Status: Succeeded
Deploy ID: 0Afd20000Gzb4fCAB
Target Org: kusumakumar233@resilient-badger-fx049v.com
Elapsed Time: 3.73s
```

Step 4: SOQL & SOSL Queries

- Use SOQL queries to retrieve maintenance requests by asset, status, or date.
 - Use SOSL sparingly for global search requirements (e.g., searching assets or request descriptions).
 - Prefer SOQL when precise filters and relationships are needed.
 - Optimize queries for bulk processing in triggers and asynchronous Apex.
-

Step 5: Use of Collections (List, Set, Map)

- Use Lists to hold maintenance requests for processing.
 - Use Sets to ensure uniqueness of Asset–Issue pairs to prevent duplicates.
 - Use Maps for efficient lookups, e.g., map asset IDs to their records or related maintenance requests.
 - Collections optimize performance and clarity in processing bulk records.
-

Step 6: Control Statements

- Use if-else conditions to implement business rules (e.g., validate priority levels, status).
 - Use loops to iterate over collections in bulk trigger contexts.
 - Apply decision logic consistently to all records and scenarios.
-

Step 7: Asynchronous Apex

- Use Future methods for lightweight tasks like sending notifications (Email/SMS) after request creation, without slowing user experience.
 - Use Queueable Apex for bulk operations such as updating statuses of requests or applying fees.
 - Use Batch Apex to process large volumes of requests, for example:
 - Automatically close completed requests older than a certain date.
 - Mark overdue requests and escalate warnings.
 - Use Scheduled Apex to automate daily summary reports or maintenance follow-up reminders to managers or technicians.
 - This ensures system scalability and process automation.
-

Step 8: Exception Handling

- Catch and handle exceptions in service classes to provide clear user messages, e.g., “Duplicate request detected.”
 - Log unexpected errors for debugging without impacting user experience.
 - Provide fail-safe mechanisms during bulk updates or external integrations.
-

Step 9: Real-World Asynchronous Use Cases

- Design Batch Apex jobs to auto-close stale maintenance requests.
 - Use Queueable Apex to assign technicians or update priorities based on workload dynamically.
 - Use Future methods to send real-time notifications (email/SMS) when a new request is submitted or updated.
 - Use Scheduled Apex for automatic sending of daily maintenance dashboards to facility managers.
-

Achievements Expected for Home Maintenance Project Phase 5

- Enforce maintenance and repair business rules via Apex code.
- Develop modular, reusable service classes with supporting triggers.
- Build and execute test classes for robustness and code coverage compliance.
- Effectively apply SOQL, SOSL, collections, and control structures.
- Implement asynchronous Apex (future, queueable, batch, scheduled) for scalability.
- Ensure robust and user-friendly exception handling.
